**CT BONE MINERAL DENSITY**

**CT BONE DENSITY**

**CLINICAL INDICATION:** Evaluate for osteoporosis

**COMPARISON:** Outside DEXA report from St. John's Health Center, 11/19/2004

**FINDINGS:**

Please refer to the printed data for details about the bone density calculations.

The limited CT images show no significant abnormalities.

**IMPRESSION:**

1. Trabecular bone mineral density of the spine correlates with a T-score of -0.34 which is in the normal range. The bone mineral density is safely above the fracture risk threshold.
2. Total bone mineral density of the hip correlates with a T-score of -1.23 which is in the osteopenic range. The T-score on the previous DEXA from 2004 was 1.3, so there is no significant change.

## CT OF THE CHEST WITH CONTRAST

CLINICAL INDICATION: Restaging of cancer.

TECHNICAL FACTORS: Scan was performed on a GE Light Speed VCT 64 Slice Scanner.

COMPARISON: None.

FINDINGS: The thyroid gland enhances homogeneously. There are no significantly sized mediastinal lymph nodes. The aorta is within normal limits for size. There is no filling defect within the pulmonary artery. There are mild to moderate coronary artery calcifications present. The heart is of normal size and without pericardial effusion.

The lungs are clear without consolidation or pleural effusion. There is no suspicious pulmonary nodule. Bronchi are minimally prominent without a true bronchiectasis. There is no consolidation or pleural effusion. There is no interstitial prominence appreciated.

Bone windows show no suspicious lytic or blastic lesions.

### IMPRESSION:

No mediastinal lymphadenopathy or suspicious pulmonary nodule.

## CT OF THE ABDOMEN WITH AND WITHOUT CONTRAST

CLINICAL INDICATION: Lymphoma.

TECHNICAL FACTORS: Scan was performed on a GE Light Speed VCT 64 Slice Scanner.

FINDINGS: The liver, spleen, pancreas and adrenal glands appear normal.

The right and left kidneys appear normal. There is no mass or hydronephrosis. There are no renal stones.

Patient: SIEGEL, MARYJO  
Date of Service: 05/22/2007  
D.O.B.: 07/05/1950  
Account #: C24897

Continued: Page 2 of 2

The aorta is of normal prominence. The IVC and portal vein are unremarkable.

The GI tract is unremarkable. There is no bowel wall thickening. There are no suspicious periaortic or mesenteric lymph nodes. There are several surgical clips seen over the mid abdomen and mesentery.

Bones are intact. There are no suspicious lytic or blastic lesions.

IMPRESSION:

1. No significantly sized lymphadenopathy or mass.
2. Surgical changes of the mid abdomen

**CT OF THE PELVIS WITH CONTRAST**

CLINICAL INDICATION: Lymphoma.

TECHNICAL FACTORS: Scan was performed on a GE Light Speed VCT 64 Slice Scanner.

FINDINGS: There is no free fluid or significantly sized pelvic or inguinal lymphadenopathy. The rectum and colon are unremarkable. The bladder is well distended and unremarkable. The uterus is probably present but difficult to separate from the colon and small bowel loops.

Bones are intact without suspicious lytic or blastic lesions.

IMPRESSION:

No free fluid, mass or significantly sized lymphadenopathy within the pelvis.
